

Card edge, 2x50 fingers. Pin 2 is rightmost seen from the component side
No series resistors, no buffers: every bus net goes straight to the module.

Four 2x8 pin strips P1-P4 round a 25.4 mm square, drawn here in the order of the GPIO numbers. GPIO0-17, 19-43 and 45 as in hardware/PINMAP.md. Different: GPIO18 microSD CS, GPIO44 / 46 / 47 I2S.

The card is powered by the Amiga, or by the module's FPC adapter on the bench. The port never powers the card.

Two 1x6 rows, 2.54 mm, 20.32 mm apart, drawn as seen from the top with the jack opening away from the viewer. Pin 1 of each row at the jack-opening end. Module silk: J1 left row (M1J1), J2 right row (M1J2).

One row of 6 pins, 3.3 V, no level shifter. Pin 1 = 3V3. Shares SPI1 with M1

GPIO45 high asserts the interrupt (push-pull, high = asserted: the drive of firmware feature int-nfet)
JP1 is bridged 1-2 as delivered: /INT2. Cut 1-2 and bridge 2-3 for /INT6.

D+ / D- from U1 P2.9 / P2.7 (27R on the module) to J2 and J3 in parallel; only one of the two is used. VBUS_PORT from the bus +5 V through F1 (power block).

The 6-pin row on its short edge, in board order. Audio leaves through the breakout's 3.5 mm jack.

DIY board (default variant): U1, M1, D1, F1, C1, C2, Q1, R1, J2 or J3.
 Optional: M2 (microSD), M3 (DAC).
 U2, C3, C4 fitted (3VS3_AUX regulator: JP2 open). Not fitted (DNP): J4
 (developers), J5 (recovery).
 JLC board (variant JLC): the SMD parts of J2 instead of D1, C1–C4

J4, J5: 1x3 2.54 mm footprints, DNP. J4 is placed clear of every other connector.

Same nets as the through-hole part: D101 = D1 (SMD), C101-C103 = C1 (SMD), ... (number x 100 + n). The DIY build fits the through-hole parts (default variant), the JLC build these (variant JLC). Never both: the pads share the footprint area.
